

Continuous Live Monitoring of Machine Learning Models with Delayed Label Feedback

Patrick Baier
Lorand Dali

Zalando Payments

June 2018

OUTLINE

Who we are and what we do

Why we should monitor

Prediction Monitoring

Our implementation

**WHO WE ARE
AND
WHAT WE DO**

WHO WE ARE

Patrick Baier

- Data Scientist at Zalando (~ 3.5 years)
- PhD in Computer Science from Uni Stuttgart

Lorand Dali

- Data Scientist at Zalando (~ 1.5 years)
- Diploma in Computer Science from the Technical University of Cluj Napoca

WHAT WE DO

Detect and prevent payment fraud

WHAT WE DO

Detect and prevent **payment fraud**

MODEL TRAINING

RUNTIME SYSTEM

- REST service
- Scala Play service with Spark bindings
- Response time: <1 second

OUR TECH STACK

WHY WE SHOULD MONITOR

SCENARIO

Let's deploy a model for fraud detection in an online shop!

Steps we take:

1. Collect training data.
2. Train a model.
3. Deploy it to production.

COLLECT DATA

```

Log data

Database

Data Warehouse

Amazon S3

Go through the systems and collect data for training

TRAINING DATA

#	Feature-1	Time-to-order [s]	...	Feature-N	Label
1	2	300	...	1	not-fraud
2	1	5	...	0	fraud
3	3	120	...	0	not-fraud
4	2	200	...	1	not-fraud
5	1	250	...	0	fraud
...

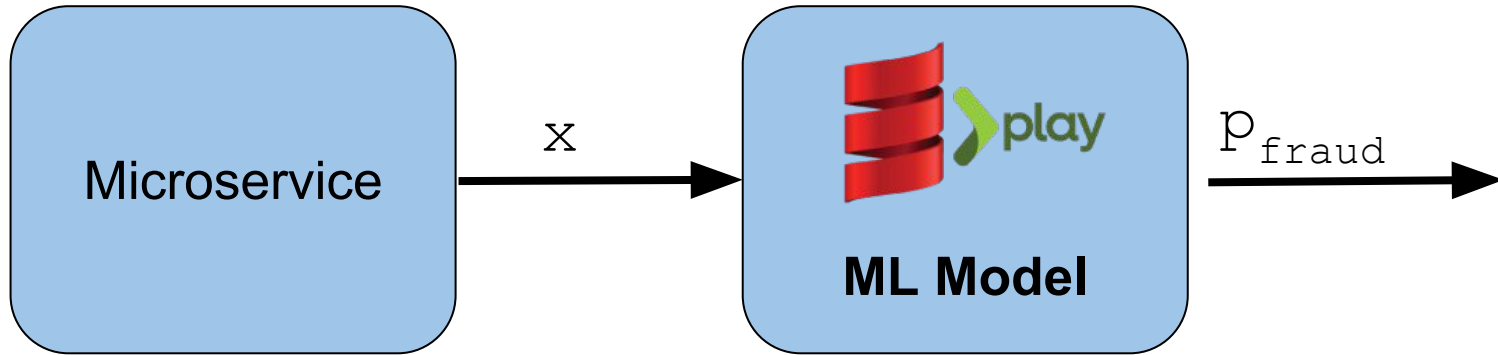

FEATURE DISTRIBUTION

Time-to-order [s]
300
5
120
200
250
...

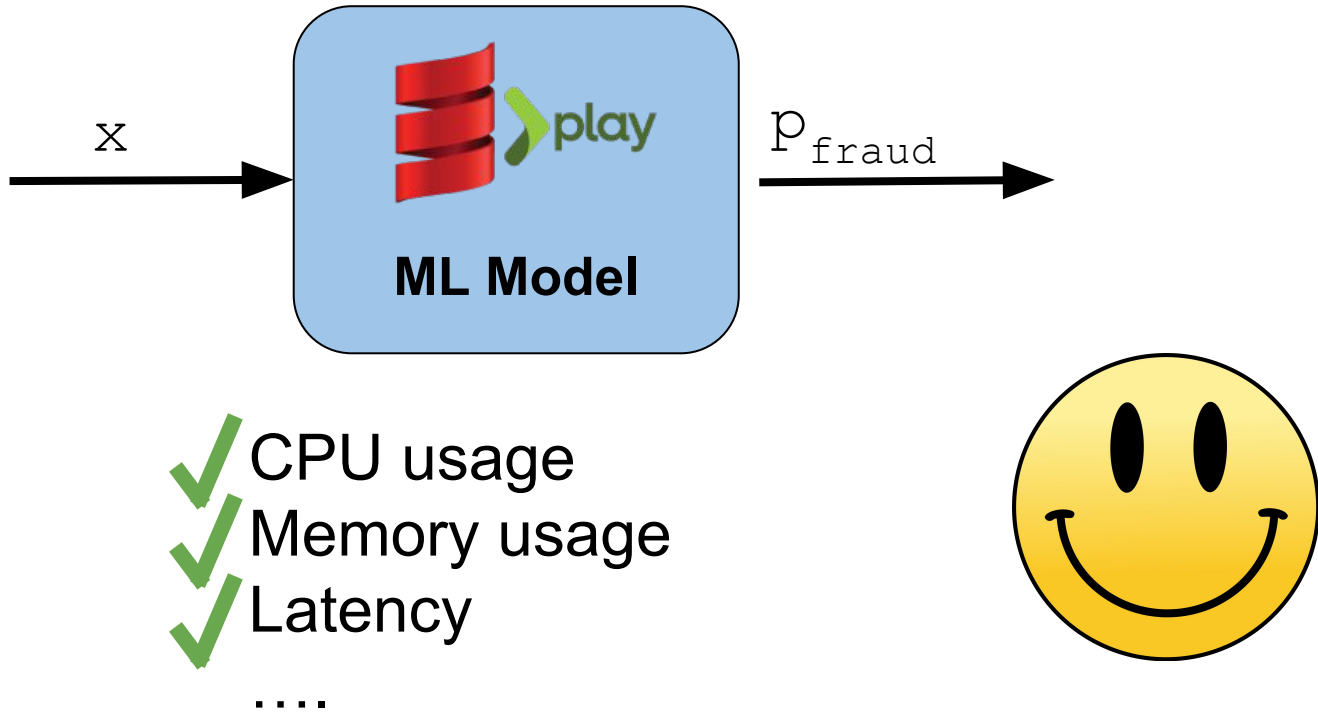

Distribution of feature in training data

GO LIVE

Once we are live, we get features x sent over by a different microservice in real-time.

MONITORING

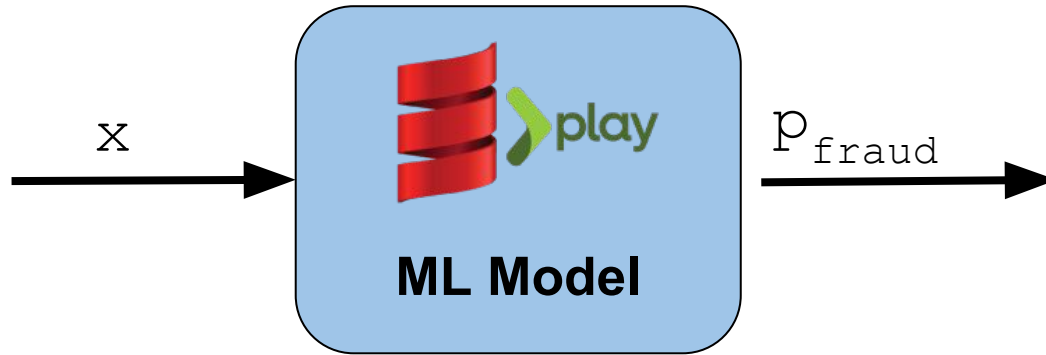

CHANGE OF MOODS

Some weeks later, people are angry:
“We fail to detect fraud, our business is ruined!”

What happened?

INVESTIGATION

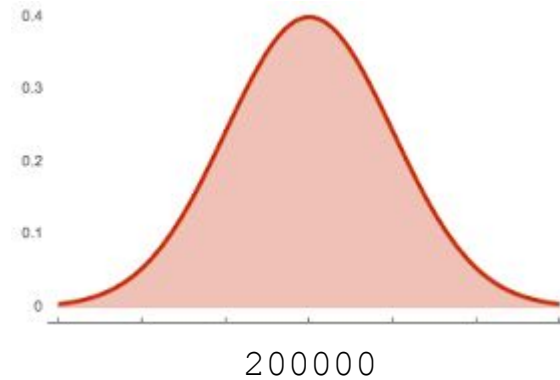

- ✓ CPU usage
- ✓ Memory usage
- ✓ Latency
-

INVESTIGATION

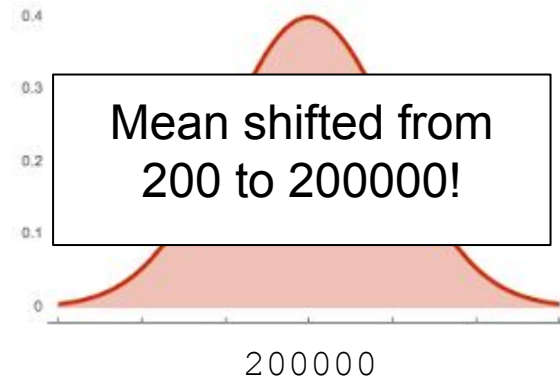

Time-to-order
300000
5000
120000
...

INVESTIGATION

Time-to-order
300000
5000
120000
...

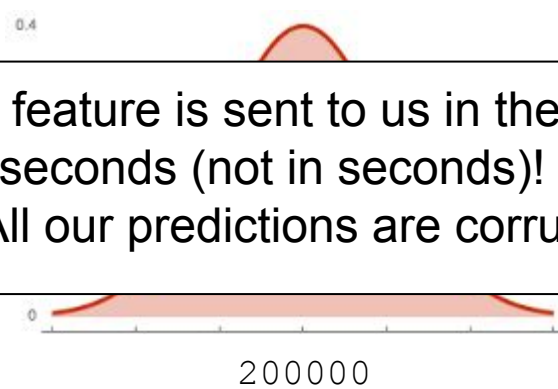

INVESTIGATION

Time-to-order
300000
5000
120000
...

The feature is sent to us in the unit of milliseconds (not in seconds)!
→ All our predictions are corrupt!

PROBLEMS

1. We lost a lot of money.
2. We did not detect it in time.
3. We could have detected it in time and provided a fix.

CONCLUSIONS

We need to make sure that the distributions of input features are (always) the same as in training.

**PREDICTION
MONITORING**

FAILING FEATURES

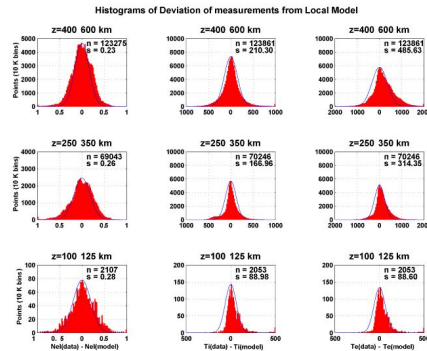

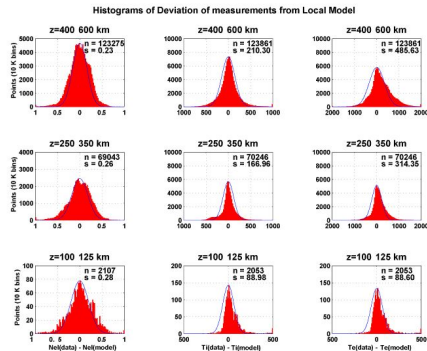

Monitor failing input features:

feature name	fraction
<i>feature one</i>	0.903
<i>feature two</i>	0.004
<i>feature three</i>	0.004
<i>feature four</i>	0.004
...	...

LIVE MONITORING

Compare feature distributions and output probability:

Feature distribution on test data

Feature distribution on live data

Quality Monitor

LIVE MONITORING

LIVE MONITORING

Compare distributions with KS-distance:

feature name	this vs previous	this vs test	previous vs test
<i>feature one</i>	0.000008	0.928806	0.928798
<i>feature two</i>	0.0009117	0.019504	0.020416
<i>feature three</i>	0.1075305	0.316970	0.313337
<i>feature four</i>	0.943896	0.943655	0.045654
...
<i>prediction</i>	6.606939e-02	0.255182	0.277325

WINDOWS SIZE

How big should the window size for data aggregation be?

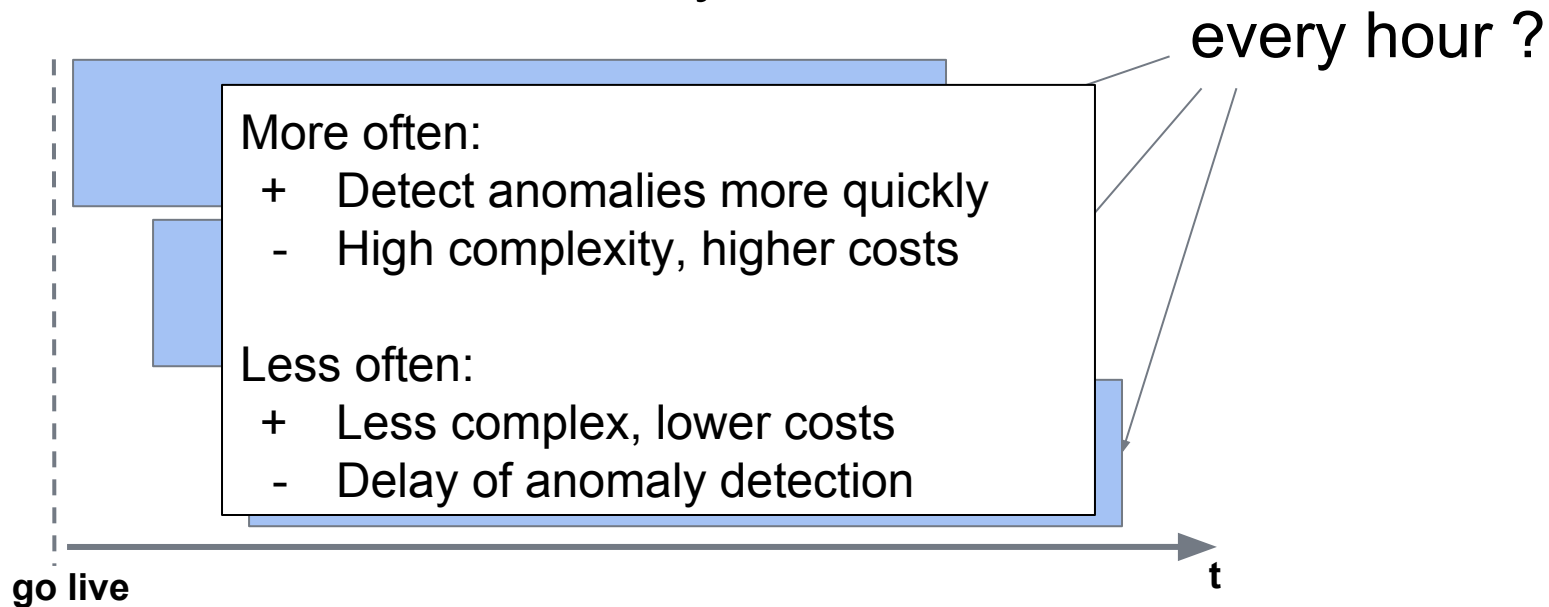

EXECUTION SCHEDULE

How often should we analyze ?

EXECUTION SCHEDULE

How often should we analyze ?

LIVE MONITORING

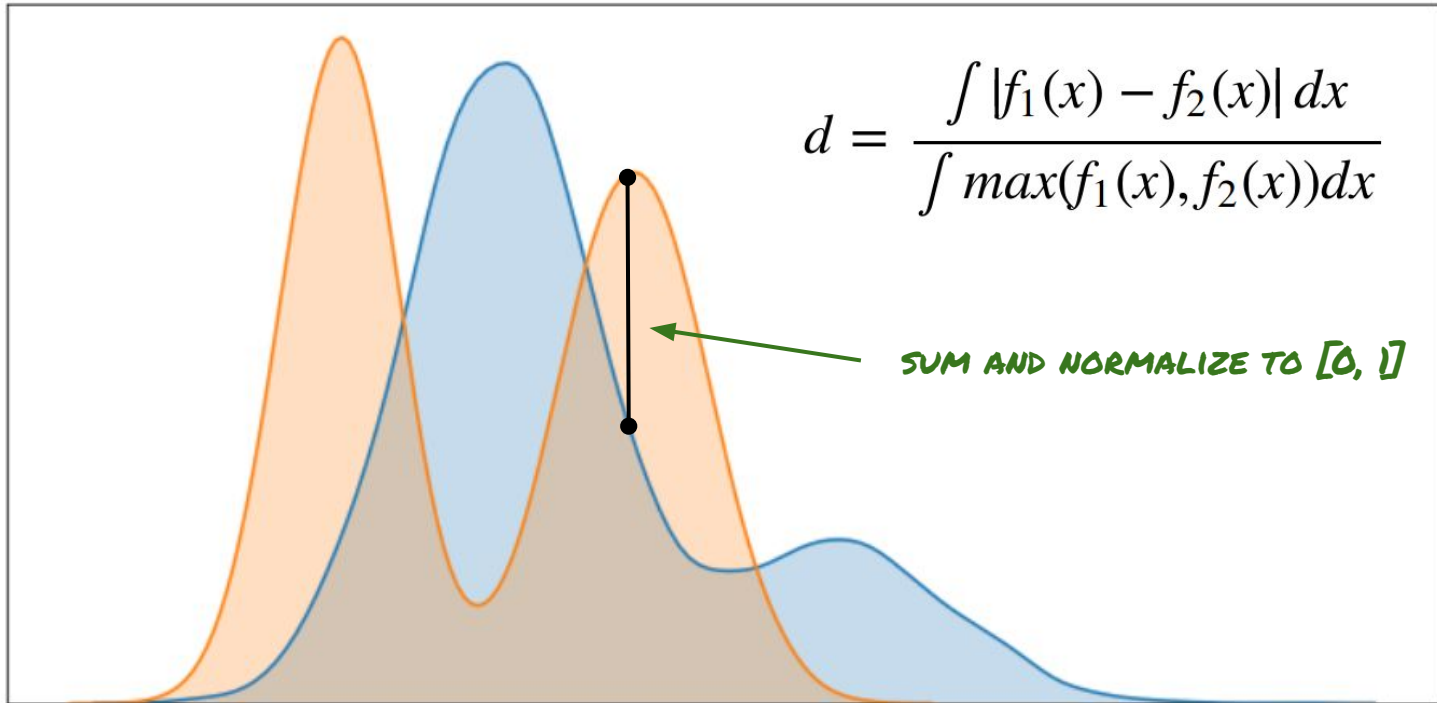

possible discoveries

technical problems,
seasonalities,
change of behaviour,
fraud wave,
fraud patterns,
deviation from expectations.

IMPLEMENTATION

DISTANCE BETWEEN TWO DISTRIBUTIONS

WE USE THE CDF

CDF

HISTOGRAM

USING TDIGEST TO OBTAIN CDF

```
import com.tdunning.math.stats.TDigest
import org.apache.spark.rdd.RDD
```

```
def create(numbers: Seq[Double]): TDigest = {
  val digest: TDigest = TDigest.createDigest(100)
  numbers.foreach(x => digest.add(x))
  digest
}
```

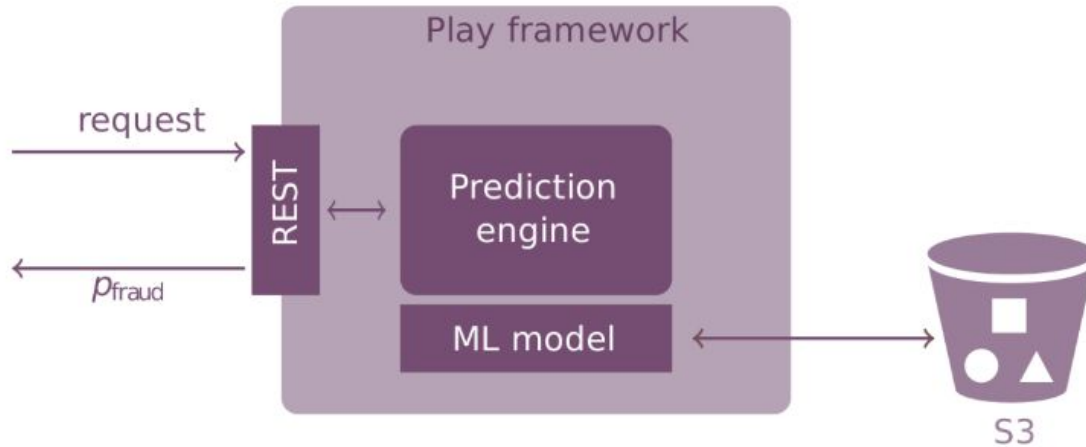

FROM AN IN-MEMORY COLLECTION

```
def create(numbers: RDD[Double]): TDigest = {
  val empty: TDigest = TDigest.createDigest(100)

  numbers.treeAggregate(empty)(
    seqOp = (acc: TDigest, x: Double) => {
      acc.add(x)
      acc
    },
    combOp = (digest1: TDigest, digest2: TDigest) => {
      digest1.add(digest2)
      digest1
    }
  )
}
```

PREDICTION SERVING

PREDICTION SERVING

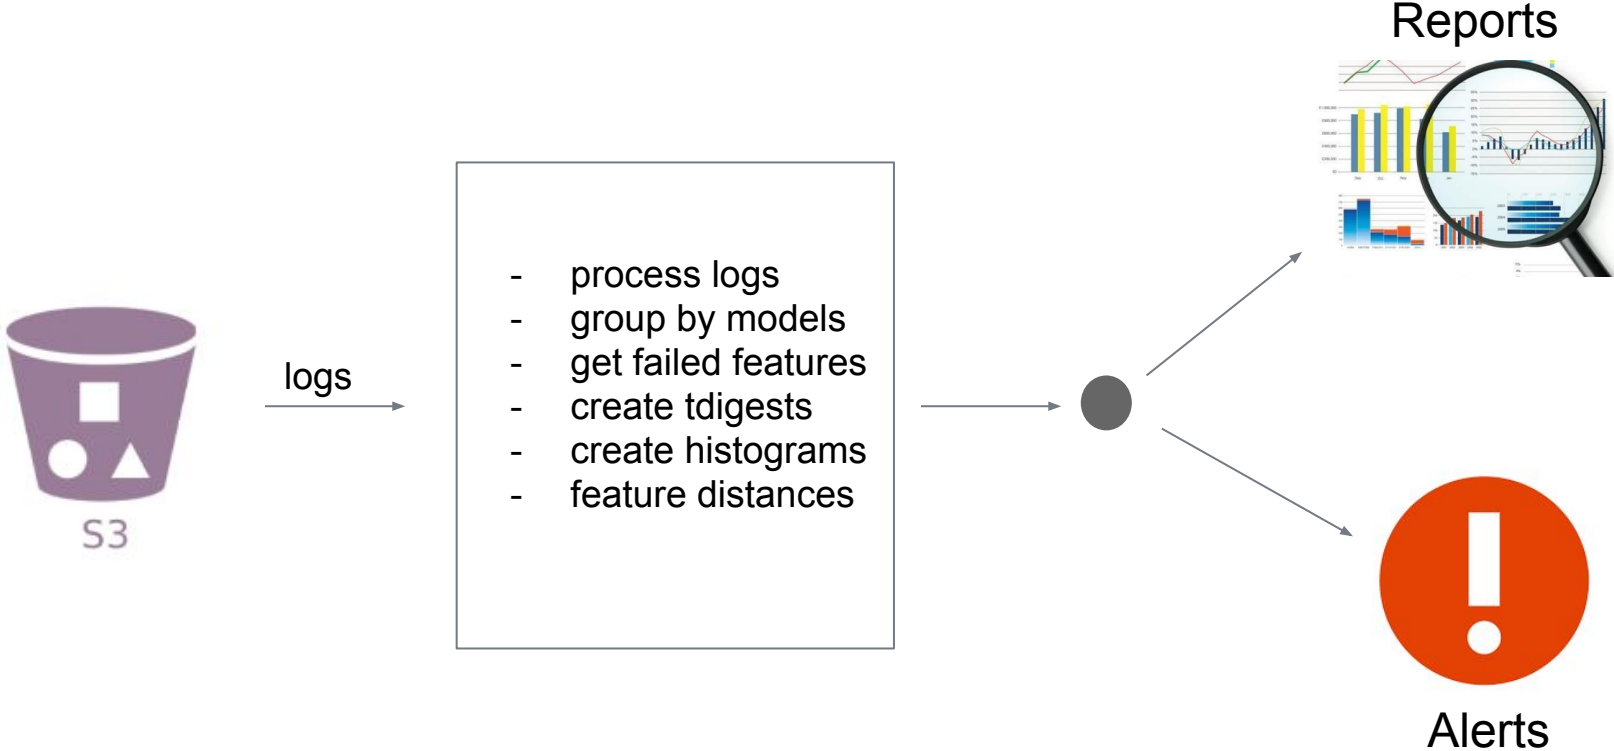

PROCESSING THE SQS MESSAGES

```
func process(sqsClient sqsiface.SQSAPI, dumpSize int,
            interrupt <- chan bool, upload func([]*sqs.Message)) {

    buffer := make([]*sqs.Message, 0, dumpSize)
    timer := time.NewTimer(maxFetchingTime)

    for {
        select {
            case <-interrupt:
                return
            case <-timer.C:
                upload(buffer)
            default:
                for _, message := range receiveMessages(sqsClient) {
                    buffer = append(buffer, message)
                }
                if len(buffer) == dumpSize {
                    upload(buffer)
                }
            }
        }
    }
}
```

PUTTING IT TOGETHER IN AWS DATA PIPELINE

FINAL NOTES

- if you have a ML system deployed in production, then you have to monitor it somehow
- monitoring is especially important if performance feedback is delayed
- start simple and non-intrusive, keep the reports flexible
- automate as much as possible
- to measure how far you are with monitoring, go through the questions in this paper from Google: *"What's your ML Test Score? A rubric for ML production systems"*

THANK YOU!
